

Enterprise Solution & Integration Blueprint

Will your systems fit together?

Make interfaces, dependencies and delivery responsibilities explicit before teams build against different assumptions.

For CIOs, product owners and programme teams connecting business-critical systems.

DEFINE THE CHANGE

Business flows
System boundaries
Constraints and risks

**AGREE THE DESIGN**

Interfaces and data
Failure and recovery
Decisions and owners

**PREPARE DELIVERY**

Executable blueprint
Transition sequence
End-to-end tests

Design the behaviour between systems as carefully as the systems themselves.

What you take away

01	Solution blueprint	Current and target views, key requirements, flows and architecture decisions.
02	Integration specifications	Interface and data contracts, error paths and responsibility boundaries.
03	Delivery and test plan	Sequenced dependencies, transition considerations and acceptance criteria.

Why AGILA

AGILA provides an independent architecture lead across business teams, platforms and delivery partners.

Solution and integration design, aligned with your governance. Implementation and specialist delivery capacity are agreed separately.

Where a platform choice is still open, assess options against the requirements before committing to a vendor.

Make the integration challenge clear.

Bring the planned change, the systems involved and the open decisions.
