Sahar

Actionnable intelligence for decisive actions

Sahar is a French software company, founded in 2019 with a global presence.

We build sovereign platforms and solutions that help governments and large organisations understand their environment, anticipate risks and decide.

Specialists in open-source intelligence (OSINT), our technologies structure and analyse large volumes of data to produce information that is reliable, traceable and directly actionable.

All of it designed, developed and hosted in France or on the client's own infrastructure, whether delivered as SaaS or on-premises, **with no external technical dependency.**

Sahar

Use cases

Disinformation and information manipulation	Real-time monitoring of events and situationsion	Open-source intelligence in sensitive environments
Illicit networks and threat financing, blockchain investigation	Mapping of actors, networks and weak signals	Anticipation of physical threats to people, assets or operations

Our sources

Around thirty social networks, clear web and dark web.

More than 200 languages, thousands of sources monitored continuously.

Agentic AI

At the core of the platform, our AI agents run the investigation themselves:

Searching across sources, cross-referencing signals, characterising the actors and delivering a structured analysis you can query in natural language.

Where the analyst once drove every step, the agents now work continuously at a scale no human team could sustain, drawing on more than 15 AI models (computer vision, language processing, translation, emotion analysis...) and a dozen visualisation and analysis modules.

Three complementary divisions

Software	Analysis	Consulting & engineering
An all-in-one platform and standalone solutions by use case, powered by our own AI agents.	A team of analysts that turns technical results into contextualised assessments and operational recommendations.	Support for public and private organisations in designing and deploying complex capabilities.
