Museums and cultural sites must protect unique heritage assets while ensuring the safety of people. These complex sites are difficult to fully understand in real-life situations, including historic buildings, heritage gardens, underground spaces, and buried networks. Museum Emergency and

Salvage Plans are often theoretical and not fully operational during a crisis.

GisInVR creates a digital twin within an immersive 3D environment, integrating the entire cultural site. The emergency and salvage plan becomes a visual and immediately usable tool,

supporting crisis preparedness, staff training, and coordination with emergency services.

Developed in France, **GisInVR modernizes the protection and management of cultural heritage.**
